

INN-FORM *Plus*™

Combining the Best in Lodging and Business Functions

Accurate Call Management, Outstanding Ease of Use

The **INN-FORM *Plus*™**, from **TEL electronics, inc.**, is the ideal call accounting system for any hotel or organization that must track the call activity of short term users, as well as store and report the calls of long term administrative departments. With certain memory options, the **INN-FORM *Plus*™** can store up to 60,000 call records.

Designed with simplicity and flexibility in mind, the **INN-FORM *Plus*™**, allows you to customize departments on site by typing in the name of the person assigned to an extension instead of just assigning it a number.

Four ports (both serial and parallel) are built into the system, allowing for a printer, remote polling and a computer to be interfaced. The **INN-FORM *Plus*™** is sensitive to the space limitations of hotel/motel front desks. With the system being 9.5 x 8.5 inches its compact size is ideal for the hospitality industry, as well as for use in hospitals, convention centers and other businesses that want to track telephone usage.

Compatibility and Dependability

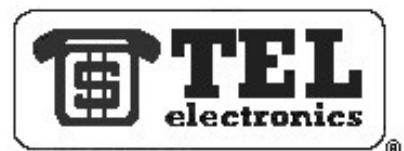

The **INN-FORM *Plus*™** is compatible with almost any Property Management System. The protocol can be customized for communication between the PMS and the **INN-FORM *Plus*™**.

To ensure that records are not lost when the PMS stops working, the **INN-FORM *Plus*™** stores calls in memory. Calls no longer need to be posted manually, because the system posts them automatically in the background as new calls are collected. Outstanding capabilities enable the **INN-FORM *Plus*™** to maximize telephone revenue by billing for newly added area codes and exchanges.
